Welcome Letter

Esteemed Delegates,

It is with the highest pleasure that we welcome you to the Junior ECOSOC at SenaMUN V. The chairs would like to emphasize that this will be the **first Junior Committee in all editions of this event**. As you read the guide, you will find that the world as we know it no longer exists—many different things have happened through history, and it is critical that you pay great attention to this guide, as all you need to know about 2100 must come from here. Therefore, this document should be your primary way to study for the committee.

We are very honored to have you on this committee and hope you enjoy it as much as we enjoy creating it. Although it is challenging to take on so much unknown information, we hope you find it exciting to enter a situation so different from the one we are now in!

We expect that, in this committee, you will find great solutions to the problems of 2100 and, most importantly, that you will enjoy this committee and feel comfortable with the other delegates and the chairs. Remember that respect stands as a guiding pillar for us and the conference. Moreover, note that all images and data in this guide are merely illustrative and AI-generated.

Expressly because it is a Junior Committee, we acknowledge factors like shyness or obscurity of procedures. Do not hesitate to contact us in case of doubts or concerns. Welcome to Junior ECOSOC at SenaMUN V.

Sincerely,

Antonio Natale

Committee Introduction

ECOSOC plenary session at the United Nations Headquarters, bringing together representatives of member states to deliberate on global policy challenges. Credits for the official UN website.

Through this guide, you will discover that many conflicts have affected nations worldwide, with an important highlight to a long-lasting war known as the Third World War. Because of this major conflict, the United Nations ceased to exist. Later, when the war ended, the countries recognized the necessity of multilateral organizations working for a common goal: establishing an effective international plan to extinguish the lack of resources that all nations were facing.

Back in 2026, the Economic and Social Council (ECOSOC) was one of the 6 main bodies of the United Nations. It was formally recognized by the UN Charter in 1945 as a place where economy, society, technology, and public services had the necessary spotlight to be discussed on a global scale.

The ECOSOC draws attention to several world organizations, such as, but not limited to, the World Health Organization (WHO), the United Nations International Children's Emergency Fund (UNICEF), the United Nations Educational, Scientific, and Cultural Organization (UNESCO), the International Monetary Fund, and the World Bank—collaborating on multilateral solutions.

This council used to stand by emphasizing policy proposals and initiatives, socioeconomic interconnectivity, international cooperation, statistical data usage, detailed resolutions, and comprehensive reports, all grounded in evidence-based policymaking.

By 2100, the nations organized an emergency conference of the ECOSOC. The conference will take place at Senac Nações Unidas on September 11 and 12, and it will address urgent global issues, particularly the common problem of resource scarcity. Given this situation, SenaMUN's session will be mandatory for all invited nations, and the agreements will be transformative. There will be no procedural changes, and all nations will be titled *UN member states*. Be prepared, because it will only happen once.

Topic: Discussing the lack of essential resources for human life in 2100

Guiding Questions:

- 1) Should water, food, minerals, and energy be considered fundamental human rights accompanying collective responsibilities, or just tools for strategic governance in such a complicated period in history?
- 2) How may national interests be balanced alongside the need for international cooperation in scarcity periods?
- 3) Considering the technological advancements discussed in this guide, does their role remain essential for the beginning of this new century?
- 4) To what extent should governments regulate the extraction and use of strategic minerals and natural resources?
- 5) In the post-WW3 period we are in, where should governments and enduring international organizations draw the line between national survival and international solidarity?
- 6) Is it still possible to rebuild a global system of diplomatic cooperation after the UN ceased to exist? Follow-up question: Who would manage to avoid interstate intrigues?
- 7) Analyze how UN bodies were structured back in 2079 and answer the question: What can we infer about the influence of certain nations?
- 8) What measures should be adopted to prevent resource scarcity from becoming the primary cause of future conflicts? Consider the following:
 - a) States are seeking peace, while also prioritizing national interests at such a delicate time as the one we are in;
 - b) Recent conflicts between countries can affect the unanimity and concealment of multilateral perspectives;
 - c) Can past damages to Earth be effectively portrayed?

Background Information

Dear delegates, the chairs would like to attach a slide presentation that contains all the background information explained: <https://canva.link/s95bhmvnm2a156t>. Here, we will quickly review this information and highlight the main events in the history of humanity until 2100.

Raising a couple of points. Initially, please remember that the thorough reading of the study guide **and** the slides prepared are of the utmost importance for your individual performance in this committee. The slides contain the entire information about the history from 2026 until 2100, and the study guide contains information about the committee, the countries, the current situation the world's nations are in, recurring and relevant events, and all important information you will need in your preparation for our beloved conference. Also, thank you very much for your trust and patience with this committee; we hope you have a lovely and engaging experience.

2050 Winter Olympics in Norway

In January 2050, the preparations for the Winter Olympics in Norway will dominate the international agenda. Host cities and partner regions across Europe have accelerated final-stage logistics by implementing completely automated transport corridors, AI-managed energy balancing systems, and tightly coordinated security frameworks to support unprecedented global participation. At the same time, worldwide media outlets continue to extensively focus on Olympic-related news. The Olympiads are still a time for unity and to "forget" tensions.

Concurrently, a quieter development occurs: official content from China becomes noticeably less visible on overseas sites, with no explicit explanation. In the final days before the Games, China surprisingly says it will not participate, giving no obvious explanation.

The Winter Olympics in Norway begin in February 2050. Every layer of the games is based on highly integrated AI systems that handle logistics, transmission, security, and real-time synchronization across various venues. Suddenly, on February 19th, during a curling competition between Congo and Turkey, a bomb exploded in the arena. Chaos and fire ensue. Olympic activities rapidly lose their ability to maintain constant system integrity, necessitating the activation of emergency protocols and evacuation of the region.

As investigations begin in real time, intelligence and surveillance centers look for the perpetrator. Eventually, footage from the arena saved in the cloud is downloaded to the computer of the International Olympic Committee.

One day later, the Chinese president, Hu Chunchua, announced on the web platform "X" that China was responsible for the attack. It seemed like they'd been developing a new deck of nuclear weapons, and they decided to use the Olympic stage to test it and show the whole world their power. Even though it didn't seem like a valid reason, it was the golden thread that tied this situation and test together.

An urgent session of the General Assembly was scheduled for the day after the publication, and Hilton suggested the arrest of Hu Chunchua in Japan. A lifelong arrest, no less. Why Japan? Well, Japan's posture in the most turbulent events in humanity's history inspires Hilton, and they're also a close country. Although WWII makes it seem controversial, Hilton relied on Japan's efforts to make amends.

For more information on what happened after this imprisonment, check the [slide presentation](#)!

*Addendum: After this event, the Olympic Committee suspended ALL games and activities until the world was considered "safe again." They also invited FIFA to join them in the measure, so they did. As the world faced more and more nonstop chaos, official sports-based activities have been suspended worldwide since then.

World War Three (WW3)

The Third World War emerged from the escalation of the Scarcity War, and its first decade became known as the Silent Decade. Unlike the world wars of the

twentieth century, this conflict did not feature continuous invasions, trench warfare, or massive bombing campaigns. Instead, nations fought it through cyberattacks, artificial intelligence, economic warfare, espionage, autonomous weapons, and proxy conflicts. Although traditional battles still occurred, most people experienced the war through shortages, surveillance, financial instability, and disruptions to daily life rather than direct combat.

Following the Autonomous Crisis of 2059, nations rapidly expanded their AI and defense programs. By 2065, more than 70% of military operations worldwide involved autonomous systems, ranging from surveillance drones to AI-assisted command networks. Global military spending reached record levels, while governments increasingly diverted resources away from public services and toward national security initiatives.

The decade also saw growing humanitarian challenges. Climate migration surpassed 500 million displaced people worldwide, placing enormous strain on cities, borders, and international aid organizations. Resource shortages remained a constant concern, particularly for freshwater, energy, and rare-earth minerals essential for the production of advanced technologies. Competition for these materials fueled diplomatic crises and occasional military confrontations across several regions.

Creation of three new sovereignties;

Cordillera State:

Meanwhile, Honduras, El Salvador, Nicaragua, and Costa Rica signed the Treaty of San José in 2083, dissolving their individual governments and forming the Cordillera State. The newly unified nation centralized resource management, border control, water distribution, and food production under a single administration. Initially viewed with skepticism by neighboring countries, the Cordillera State rapidly

emerged as one of the most stable political entities in Latin America, demonstrating that regional integration could provide greater resilience against resource scarcity than traditional national structures.

Cordillera's State flag

Atlantic Union:

On the other hand, by the early 2090s, the United States faced its worst crisis since the Civil War. Decades of resource shortages, climate migration, economic collapse, and the prolonged Scarcity War had created two competing visions for the country's future. The eastern states — more densely populated, urbanized, and dependent on international trade — argued that survival depended on diplomatic engagement, technological innovation, and resource-sharing agreements with foreign powers. These states had become major hubs for artificial intelligence, finance, biotechnology, and automated infrastructure. The central and western states possessed most of the nation's remaining agricultural land, freshwater reserves, mineral deposits, and energy production facilities. Their leaders increasingly opposed transferring resources to coastal population centers already struggling with overcrowding and migration crises. Tensions escalated in 2093 when Congress approved the National Resource Allocation Act, requiring western states to redirect significant portions of their water, food, and energy reserves to eastern metropolitan regions. Several governors openly refused to comply, while eastern leaders accused the federal government of abandoning millions of citizens. Rather than risk a new

civil war, representatives from both blocs negotiated the Denver Accords of 2093. The agreement formally dissolved the existing federal structure and created two successor states:

United States of America

Atlantic Union

Soviet Siberian Republic:

Furthermore, with the Iron Dawn Incident, Russia presented itself to the world as an advanced but still poorly organized country. Moscow claimed that all of Russia was responsible for what happened. However, the Asian side of Russia, separated by mountains, denied these allegations and blamed the other side of the country.

Fearing conflict, the Asian side built military outposts in the mountains. Weeks later, seeing that they did not cause conflict, they realized that the other side of Russia poorly represented them. With this wave of rebellious thought, the people united and proclaimed independence from the other side of Russia on October 30th, 2059.

The name of the "former Asian side" is now the Soviet Siberian Republic, which operates under a socialist/communist system to return to the glory of its golden age, the Soviet Union.

UN Secretaries-General over the years and the handovers of the baton:

On the 1st of January, 2017, António Guterres assumed the position of UN Secretary-General. He held the position until 2039, the unfortunate year when doctors diagnosed him with advanced lung cancer. A year later, after his death, representatives of member states struggled to decide on his successor. Erika Hilton, who had served as the president of the UN Human Rights Council for the past years at that time, was selected and, surely, performed with mastery. In her first address, she declared: "The world doesn't need more promises. It needs courage, redistribution, and honesty. Survival cannot belong to the few, and peace cannot be postponed." Hilton faced tough years with wars and disasters, and in 2064, amid the challenges of a World War, she announced her designation. Simultaneously, Rafael Porciuncula, a Brazilian formed in international relations and public policies and a member of the Brazilian Embassy in the U.S., got recommended for the position by Hilton. Following the unanimous approval by member states, Porciuncula became the new Secretary-General of the United Nations. He lasted until the end of the body but continued to be known as the last UN Secretary-General.

Historical Background

Healthcare systems and private privileges until 2080:

While healthcare systems have become increasingly inaccessible for most of the world's population, the benefits have been numerous for the upper class. In 2047, the Brazilian hospital Rede D'Or São Luiz hired European researchers to conduct joint research with its doctors to develop mechanisms to increase human life expectancy. Ten years later, they created the famous "Pill Plus," exorbitantly expensive but effective. This medication allows for an increase in life by up to 30 years. Scientifically, the reason for this is not yet proven. However, several patients report its effectiveness. In 2058, at an incredible 107 years old, the Brazilian TV presenter, Serginho Groisman, decided to take the medication. As a result, he lived until 2079. The product is only sold in American countries due to its high transportation costs, and the Pan American Health Organization does not allow its sale, considering it "continental property."

Food and water resources until 2100:

Water and food, also considered by most as the most valuable and important resources to human life, have become increasingly scarce during the 21st century, according to public records and surveys.

Fresh water, which used to be around 3% of the world's water supply, is now under unprecedented pressure due to population growth, pollution, climate change, and unsustainable consumption patterns. At this moment, consumable water constitutes 1.7% of the Earth's supply. Today, billions of people experience long periods of water insecurity, and many regions face recurring drought periods with declining water quality.

Similarly, food security has become one of the world's most pressing concerns and a privilege that only some populations have. Rising temperatures, extreme weather, armed conflicts, and various disruptions to global supply chains reduce

agricultural productivity in many regions. At the same time, the world's population continues to rise, and, therefore, the demand for food increases constantly. As a result, around 1.5 billion people are affected by hunger and malnutrition despite advances in technology.

The growing scarcity of water and food extends beyond human concern, and it increasingly represents a challenge to the international community. Competition over limited resources intensifies tensions between communities and states, contributes to migration and displacement, and aggravates poverty. In consequence, the States must find a way for balancing the use of these resources to ensure that the world remains capable of meeting the needs of both present and future generations.

The Iron Dawn Incident (September 12th, 2059):

The Iron Dawn Incident marked one of the most important moments in 21st-century history, not only because it separated Russia into two different states but also because it ended the Scarcity War and triggered the start of World War Three.

Background

The Scarcity War was one of the most dangerous periods that the world went through during the century, especially because of the extreme climate change, lack of resources, intense migration, and many other factors.

At the same time, military technology had been advancing rapidly since the Chinese incident and Japan's refinement of that technology. The world was always searching for more ways to include artificial intelligence in warfare, and many nations ended up competing against each other to guarantee "superiority." That way, seeking to remain competitive, Russia invested heavily in many AI-driven command-and-control networks of arms, capable of coordinating thousands of autonomous assets simultaneously.

The Incident

After the Russian Federation invested in that technology, the country, claiming to be experimenting with it, chose to “attack” areas on Russian territory that did not have human life at the moment. Unfortunately, during the experiment, technical malfunction led autonomous arms to strike regions that were not only occupied by civilians but also military regions and public infrastructures.

Within hours, the regions close to where the technology was being experimented on were mostly dismantled, with a good part of those populations having passed away, given that there wasn't enough time to alert all of the dangers regarding those zones.

The Russian Separation

Following the incident, public trust in the government collapsed, particularly in Siberia and the Russian Far East. Those regions declared that the failure did not represent the entirety of Russia, claiming that the government was at fault for the technical mistakes (something that Moscow did not take responsibility for, even though they did publicly state that the incident was not the nation's intention).

As international pressure and political mistrust grew, regional authorities established military positions throughout the mountain corridors that separated Siberia from western Russia. That crisis only fueled the growing independence movement already flowing in Siberia, and, on October 30th, 2059, Siberian representatives declared the independence of the Soviet Siberian Republic (SSR), which now is more commonly known as "Siberia." The new state rejected all responsibilities related to the incident and only blamed Moscow for the crisis that the region claimed to not have wanted nor controlled.

The Start of World War III – September 12th, 2059

The start of WWIII was not like the start of previous world wars. While the other ones started with international matters and conflicts, this one started because of mistrust. Previously and during the Scarcity War, many countries were already

involved in conflicts, specially because of the development of AI-led warfare and the diminishing of general resources.

After the Iron Dawn Incident, many nations started to assume the worst regarding the Russian Federation (with some countries even accusing Russia of deliberately attacking its people). That led the world into a temporary chaos, with border forces mobilizing around the Russian territory; many military alliances were activated, and many defense systems were armed around the globe. Although the already existing conflicts did continue, no new ones emerged during the chaotic period that the planet encountered at the end of 2059.

World War III (2059–2099)

*To get more information regarding WWIII, please read the background information; still, we recommend taking a look at the [slides](#).

World War III did not start like other World Wars, as you could read in the previous subtopic. But nonetheless, many marking moments still characterized the war as its main moments.

The end of the United Nations

In 2079, the United Nations effectively ceased to function as the world's principal institution for international cooperation. Years of escalating global conflict, political fragmentation, cyberattacks, and the destruction of important UN buildings had dramatically reduced its ability to operate. Peacekeeping missions ceased, humanitarian programs shrank, and an increasing number of governments no longer recognized the organization's authority or mediation efforts.

As major powers formed international blocs that opposed each other (with independent economic systems, security alliances, and digital infrastructures), the world lost its only universally recognized platform for multilateral dialogue. Although a handful of UN offices remained open, they no longer possessed the legitimacy, resources, or influence necessary to coordinate global action.

Past UN actions

In spite of the United Nations ceasing to exist in 2079, it remained active throughout much of the twenty-first century. During this time, the organization adopted several resolutions and recommendations, many of which focused on the challenges and consequences of the war, although most weren't properly followed.

S/RES/3155 (2033) – UN Resolution about resources extinction

The United Nations Security Council's (UNSC) resolution regarding resources was the one thing that helped the war happen later than expected. When the countries thought they would be entering a war in the 2030s, this resolution helped delay the conflict. While many countries lacked resources and wanted to invade other nations to get them, the 3155 resolution guaranteed:

1. UN Resource Scarcity Early Warning System (a UN database monitoring food, water, and energy shortages around the globe);
2. Encourage neighboring states to negotiate resource-sharing treaties;
3. Mandates the creation of regional emergency reserves of:
 - a. Food;
 - b. Water purification equipment;
 - c. Fuel;
 - d. Medical supplies.

Although this resolution helped many nations during the Big Break of Resources, the lack of such was still a critical point, especially to Global South that couldn't make storage.

The Oslo Specialized Protocol (2050)

When the critical attack happened in the 2050 Winter Olympics at Oslo, Norway, the world, in chaos, needed support, and many people required a resolution. That way, the United Nations Secretary-General Erika Hilton, understanding the

situation, called for an emergency session of the General Assembly. That session created the Oslo Specialized Protocol, which contained mandatory clauses with these objectives:

1. China is taken away from the Permanent 5 members of the Security Council, effective immediately;
2. The chinese president, Hu Chunchua, is to be arrested in Japan;
3. The use of Autonomous Weapons Systems (AWS) is to be researched, with the objective of future prohibition with a new Treaty of Non-Proliferation for AWS.
 - a. Note: Autonomous Weapons Systems (AWS) are basically any weapon that utilizes Artificial Intelligence (AI) and is only partially operated by humans;
 - b. Note: There is a strand of AWS called Lethal Autonomous Weapons Systems (LAWS), also known as "killer robots," that is fully operated by AI during the entire processes of identification and killing of a target;
 - c. Both AWS and LAWS are legal but their use is strictly bound by the International Humanitarian Law (IHL);
4. The Winter Olympics of 2050 will be investigated to discover if another country or person was involved in the attack.

A/RES/105/1 (The Creation of the IRC) (2051)

The 105th session of the General Assembly (GA) brought many discussions regarding the current situation (of 2051) of the world. Many countries, especially the neutral ones, like Norway, Switzerland, etc., say it is imperative that the world start to take more care of all resources. Therefore, the Kingdom of Norway proposed the following topic, which the assembly approved with 75% support:

1. The creation of the **International Resource Commission**;
 - a. The commission was an organization tasked with monitoring global access to food, water, energy, critical minerals, and other natural resources;

- b. The commission would provide annual reports and recommendations regarding resources, but unfortunately most recommendations weren't completely nor partially followed.

A/RES/105/24 (Recommendations onto AWS) (2051)

In the 24th resolution of the 105th reunion of the General Assembly, members discussed various factors regarding AWS and LAWS. Following the extensive debate, the General Assembly adopted a set of recommendations aimed at promoting accountability, transparency, and international security. Although several Member States did not fully implement these measures or even agree with the resolution, it established the following key provisions:

1. Transparency Reports;
 - a. All Member States should deliver an annual report detailing the development, testing, deployment, and export of autonomous weapons systems;
2. Meaningful Human Control;
 - a. Member States are encouraged to ensure that lethal decisions involving autonomous weapons remain subject to meaningful human oversight and review;
3. Civilian Protection;
 - a. Member States are urged to avoid testing autonomous weapons systems in areas where civilian populations may be exposed to unnecessary risks;
4. Periodic Review;
 - a. The General Assembly recommends the continued review of developments in autonomous weapons technologies through future discussions within the First Committee;
5. Defensive Deployment;
 - a. Member States are urged to limit the use of AWS and LAWS to defensive and security operations, and to avoid their deployment in

offensive military campaigns that may increase the risk of escalation and civilian harm.

The Secretary-General Memo of Outrage about Rising Conflicts (2054)

In 2054, the United Nations Secretary-General Erika Hilton gave a public speech about her outrage regarding recurrent situations. The speech was:

"In these years of conflict, one would believe that people would attempt to help others, not harm them. A couple years ago, we entered what is being called by many the 'Scarcity War' or even 'Cold War II,' and I understand the reason given that such unfortunate names were given to the pressing situation before us.

Take, for an example, the Arctic Standoff of 2053. The world had just gained access to newly discovered rare-earth deposits in Greenland and the Arctic, and nations began disputing for economic advantage, which led to a diplomatic crisis all around the world, naval deployments, cyberattacks, and many other things just to prevent nations from getting the resources.

At a time when climate change has displaced hundreds of millions of people and placed unprecedented pressure on food, water, and energy supplies, the international community cannot afford to transform every discovery into another source of division, into another reason to fight with each other. The technologies we create, even with the use of artificial intelligence, must be used to protect humanity, not to worsen or create new conflicts.

The United Nations founded itself on the principle that cooperation is stronger than confrontation. Today, I call upon all Member States to recommit themselves to dialogue, transparency, and peaceful cooperation. The challenges of the twenty-first century cannot be solved by military escalation, resource nationalism, or technological arms races. They can only be solved together, through unity of the nations, not division.

In this moment, I, Erika Hilton, stand in support of the Humanist Revival, a movement that is challenging the world's tendency of celebrating power while neglecting people. At a time when nations race to develop ever more advanced

technologies and weapons, the Humanist Revival reminds us that progress is meaningless if it comes at the expense of human dignity. It asks us to remember those who suffer, those who are displaced, those whose stories must not be forgotten, and those whose humanity must never be reduced to a statistic.

Let us choose cooperation over competition, dignity over domination, and humanity over hostility. Our future depends on it."

Five-Year Strategic Resources Framework (5YSR)

In 2057, the 7th session of the International Resources Commission (IRC) was convened, bringing together nations from around the world to address the challenges surrounding the management, distribution, and sustainability of strategic resources. Amid increasing geopolitical tensions, climate-related disruptions, and rising global demand for critical materials, Member States recognized the need for greater international cooperation.

Following weeks of negotiations, the Commission adopted the Five-Year Strategic Resources Framework (5YSR), a comprehensive set of recommendations for strengthening resource security, promoting sustainable development, and reducing the risk of international conflict over scarce resources. The framework aimed to encourage transparency, equitable access to essential resources, technological cooperation, and long-term planning to ensure that future generations would not face the same resource shortages and disputes that had characterized the previous decade.

Unfortunately, as most proposals and recommendations from the IRC, the 5YSR wasn't properly followed by most, if not all, nations because of either greed or impossibility to follow the recommendations, the second one happening mainly with countries from the Global South.

Emergency Conflicts Protocol (2065)

With the start of what would be futurely known as World War Three, the world wanted to know how the United Nations would position itself, since its main objective was guaranteeing peace, but the world had entered another world conflict. Many speculated that the UN would end its actions, just like the League of Nations did with World War II. However, the United Nations was promising to stay "brave" and "permanent," and, in that situation, the organization reunited to create the Emergency Conflicts Protocol.

The Emergency Conflicts Protocol (ECP) was adopted during an extraordinary emergency session convened in Geneva in mid-2065, and it was considered an effort to ensure that the United Nations would continue carrying out its most essential functions despite the outbreak of a global conflict. Recognizing that traditional peacekeeping and diplomatic mechanisms were becoming increasingly difficult to maintain, Member States focused on preserving humanitarian operations, diplomatic communication, and international coordination.

Among its principal measures, the protocol established emergency communication channels between states involved in the conflict, expanded cooperation between UN agencies operating in war zones, and created special procedures to accelerate the delivery of humanitarian aid. The framework also encouraged Member States to maintain diplomatic dialogue even during active hostilities, with the goal of reducing civilian casualties and preventing the conflict from escalating further.

In its early years, many observers viewed the protocol as a symbol of the UN's resilience and determination. Although the protocol did not prevent the continuation of the war, it allowed many UN agencies to remain operational throughout the conflict. Humanitarian missions, refugee assistance programs, and emergency medical operations continued functioning in several regions despite difficult conditions. However, as the war continued and geopolitical divisions deepened, the limitations of the protocol became increasingly apparent. Many major powers

ignored UN recommendations when they conflicted with national interests, and the organization's influence gradually weakened.

Budgetary Announcement of 2070:

In 2069, the "Collapse of Consensus" occurred in Geneva, where over 40 nations decided to discontinue their funding to the United Nations, which triggered the most severe financial crisis in UN history, severely impacting the organization and all its projects, missions, humanitarian operations, development programs, and administrative functions across the globe.

Facing a rapidly widening budget deficit, the Secretary-General delivered an emergency budgetary announcement before the General Assembly in early 2070. In his address, he warned that **the United Nations was approaching institutional collapse** and urged Member States to restore their financial commitments before irreversible damage was done. He stated that, without immediate financial support, the organization would have to reduce several projects.

Despite the urgency of the appeal, political divisions among Member States continued to deepen. While some countries pledged emergency contributions to keep the organization functioning, others argued that the UN had become ineffective and no longer reflected the geopolitical realities of the late twenty-first century. The crisis exposed the fragility of the international system and marked the beginning of a steady decline in the authority and influence of the United Nations.

Historians often identify the Budgetary Announcement of 2070 as a turning point, as it was the first time the international community firmly confronted the possibility that the United Nations might not survive into the next century.

Current Situation

After the United Nations (UN) was destroyed back in the Third World War, the concept of international geopolitics blurred a bit. The UN used to serve as the framework that mediated tensions and managed world affairs, and when it ended — especially with such global tension — the world lost a key structure for managing these issues.

The Palais des Nations was abandoned, and Switzerland decided to use it as a governmental building to accommodate a couple of ministers.

On the fifth of January, 2100, Rafael Porciuncula, the UN's Secretary-General by 2079, asked the Brazilian government to schedule a formal session with nations to discuss the future of humanity and its essential resources. Hence, 20 of the most influential nations in the world were invited. Taking place at Senac Nações Unidas from 11 to 12 September of this same year, the topic stands as **"Discussing the lack of essential resources for human life in 2100."** Even though, formally, the UN ceased to exist, the adopted model will be that of an economic and social council to ensure effectiveness.

Furthermore, the recent '90s decade is leaving scars that only diplomatic cooperation may heal. The war evolved from one based on cyberattacks, artificial intelligence, economic warfare, espionage, and autonomous weapons into a conflict of exhaustion, where nations continued fighting not because they could win but because they had forgotten how to stop. The resources were ending: not enough water for the military nor for civilian consumption; scarcity of strategic minerals essential for advanced weapons, batteries, and electronics; mass climate migration (with over 1 billion and 900 million people dislocated worldwide); and deadly diseases linked to poor sanitation and healthcare systems. Experts warned that humanity was approaching a point where shortages would no longer be temporary crises but permanent conditions.

By 2100, global freshwater availability had declined by an estimated 63% compared to 2050 levels. Nearly half of the world's population lived under some

form of water rationing, while agricultural yields in several regions had fallen by around 37%. The effects of decades of conflicts, environmental degradation, and climate change had severely impacted the world's essential resources. According to estimates from international research institutions:

- Over **150** countries had implemented some form of seasonal or permanent rationing of resources like food or water;
- Global agricultural production had decreased by an estimated **47%** since 2050, with some regions experiencing losses exceeding 80%;
- Known reserves of several critical rare-earth minerals had fallen to less than **54%** of their estimated 2050 levels, intensifying competition over remaining deposits;
- Nearly **2.5 billion people** had been displaced by a combination of climate-related disasters, resource shortages, and armed conflicts;
- Over **4.7 billion** people lived in regions classified as experiencing high or extreme water stress.

In the meantime, access to advanced technology had become a major source of power. While some nations maintained artificial intelligence systems, automated industries, and modern infrastructure, others experienced technological decline due to shortages of energy and strategic minerals. As a result, a growing divide emerged between technologically advanced states and those struggling to meet basic needs, making access to technology nearly as important as control over territory.

Amid these developments, public trust in governments declined throughout the 2080s and 2090s. Many citizens criticized leaders for prioritizing military competition and resource control while humanitarian crises continued to worsen. In this context, movements such as the Humanist Revival gained support by advocating international cooperation, criticizing technological militarization, and emphasizing human dignity, migration, and humanitarian assistance.

Brief Case Study 1: The Arctic Extraction Dispute (2087)

With the scarcity of mineral reserves, nations intensified conflicts to dominate the Arctic. This highlighted the growing competition for strategic minerals essential for energy systems, artificial intelligence, and advanced manufacturing. A year later, environmental studies concluded that more than 5.7 million animals in the region had died. Much more than a simple risk to the Arctic area, it exemplified the desperation of nations in the search for resources. Currently, the Arctic has become a no-man's land, a land of unfortunate conflict.

Brief Case Study 2: The South Food Accord (2098)

In 2098, a Cordilleran farmer (born in the Cordillera State) sent a complaint to the government, stating that he was "confused about the country's agricultural policies." This request reached other South American nations, and through this approach, they established a coordinated system for production. The coordinated system required fruitful irrigation, along with water conservation and the sale of food at a fair price, which local municipalities began to oversee. As a result, agriculture in the region began to show significant progress and recovery post-WW3. This example demonstrates that international cooperation remains possible, even in difficult times like the one we are living in, and shows its value.

Artistic Development Throughout the Century and its Currency

Between 2055 and 2062, the world experienced an unprecedented movement: the Humanist Revival. As governments began to pay less attention to populations and more to national progress, there was a search to restore attention to the human condition from an artistic perspective. The Background Information section explores this campaign in greater detail.

Concomitantly, the musical field also evolved. Below, we list some of the most influential albums of the last century:

🎵 Taylor Swift, in 2029, launched *Dear Diary* — her farewell album to pop after years of accumulating a fortune.

♪ Then, in 2034, Bad Bunny released *Fronteras* — his album criticizing globalization beyond borders and emphasizing the importance of battling for a better world.

♪ Also by 2034, Liniker broke a record and became the first trans artist to win Album of the Year at the Grammys — more specifically, with her indigenous-based album named *Bulla*.

♪ While in 2048, BTS introduced *Seollibhada*, which aimed to celebrate the establishment of true friendships and relations that last a lifetime.

♪ Moreover, the Brazilian funk industry continued to grow, as in 2072, Pedro Sampaio launched *Protocolo Meia-Noite* — a sequence full of club hits to help you escape from reality just with simple beats.

♪ The daughter of Shawn Mendes and Bruna Marquezine, Talita Torres, liberated a single in 2087 that became an instant best-seller called *Nostalgianism*, occupying Billboard's Top 1 for four months in a row.

♪ The 2099 charity single *Attention* shocked the world by uniting artists all over the globe to address post-war recovery as if it were a musical perception — enabling the feeling of glory in many who were downcasted. German artist Manhuel Beckenwhast led the initiative.

Ultimately, delegates must decide how to manage the remaining essential resources: through international cooperation, regional agreements, market mechanisms, wars, or national sovereignty. Delegates must take these actions seriously, as they will shape the 22nd century with recovery or more collapse.

Country Positions

Country	Description
Japan 	Japan was transformed from a technologically advanced but relatively restrained power into one of the world's most controversial military and geopolitical actors. After the 2050 Olympic attack and the arrest of Chinese President Hu Chunhua, Japan obtained information that enabled it to develop powerful autonomous nuclear weapons, becoming a major global threat. With the collapse of the United Nations, international constraints weakened, allowing Japan to expand its military and technological capabilities. Humanitarian concerns remain significant, as Japan's development of AI-powered weapons contributed to militarization, insecurity, and global instability during the second half of the century. Despite this, Japan maintains a well-organized political system and strong technological capabilities. Its main concerns entering the conference are protecting its strategic advantages, securing scarce resources, preventing international isolation, and maintaining national security while facing widespread international distrust over its autonomous nuclear weapons. Prime Minister: Aiko Tanaka (53 years old) She used to act as the president of the UNSC, but with the fall of the UN, with her influence on Japan's political system, and with the death of the former prime minister, she quickly assumed the position. Regarding her education, she studied law at Vietnam's Hanoi Law University.

	Speaker of the House of Representatives: Quehu Okubo (80 years old) A Chinese-parental ancestor, she was born in Osaka after her parents immigrated to Japan. Her oratory skills are stunningly impressive. Quehu's background is highly mysterious, but the chairs were able to find her name registered in Babson College's archives — but keep the details a secret, please. Chief Justice of the Supreme Court: Gemini Yaktore (52 years old) First, in case you want to understand the reason behind the selection of this name, ask Gemini's parents. Secondly, he also studied law at Vietnam's Hanoi Law University, alongside his workmate and past classmate, Aiko.
People's Republic of China 	The People's Republic of China lost much of its influence during the pre-war years and World War III. The unauthorized use of weapons against civilians, the loss of its UN veto power through the Oslo Specialized Protocol, and the Scarcity War severely weakened its position on the global stage. Throughout the war, China experienced significant internal and external changes. The country had two presidents, with the second establishing a violent military dictatorship in 2068. Although the dictatorship ended in 2098, China remained politically unstable, with elections announced for 2101. During all the past events of this committee, China suffered a dramatic decline in international influence following decades of conflict, the 2050 Olympic attack, the loss of its permanent Security Council position, and the consequences of the Scarcity War. Despite this

	instability, China remains strategically important because it possesses the largest amount of natural resources in Asia, although its humanitarian conditions remain concerning due to authoritarian rule, resource restrictions, and political repression. China therefore enters the conference focused on restoring international legitimacy, protecting its resources, managing its political transition, and preventing other states from exploiting its weakened position. Prior Head of Government Li Weihao (36 years when he took Hu Chunhua's place, is now 86 years old) After Hu Chunhua's arrest, Li Weihao stabilized China and improved its international image by distancing the country from his predecessor's actions. However, it was later revealed that his government was developing large numbers of Autonomous Weapon Systems (AWS). Head of Government: Mi Winish (59 years old) Concern over China's AWS program led military chief Mi Winish to stage a coup in 2068, establishing a military dictatorship. The regime restricted resources in the name of sustainability and violently suppressed opposition. Growing unrest during the 2080s contributed to population decline and increasing instability. In 2098, Winish ended the dictatorship and announced elections for 2101.
Kingdom of Norway	Norway is strongly associated with the devastation of the resource crisis because it hosted the 2050 Winter Olympics, where the autonomous weapons attack occurred. The country became one of the major victims of the conflict, suffering severe damage to its

infrastructure and international position. Throughout the war, Norway experienced significant disruption and destruction after the 2050 Winter Olympics became the site of the autonomous weapons attack. It was deeply affected by the conflict, becoming one of its major victims.

Despite these challenges, Norway maintained political stability and remained an important actor in resource management. Historically, it also supported the creation of the International Resource Commission. By 2100, Norway's main humanitarian concerns are post-conflict reconstruction, protecting its population, and maintaining access to essential resources.

Entering the conference, its priorities are resource-sharing, humanitarian protection, international stability, and preventing future conflicts caused by autonomous weapons or competition over scarce resources

Prime Minister:

Mark Perø Robertsy (100 years old)

A veteran and a Norwegian legend, Mark approaches with experience and great years of management after the Olympic catastrophe and the nation as a whole.

President of the Storting:

Gerald Maskhy (87 years old)

He studied medicine and got his PhD at the University of California, San Diego. Regardless, he also emerged in politics because of his father, Oliv Maskhy, who served as Norway's President of the Storting in the first decade after the catastrophe.

**Federative Republic of
Brazil**

Brazil is certainly one of the most important nations of the past decade. The Brazilian Mariano Teixeira led the Humanist Revival. The two UN Secretaries-General who succeeded António Guterres were also Brazilian, and the Government of Brazil was responsible for submitting the request for the SenaMUN.

Regarding Brazil's positioning amid WW3, it operated in the faith of peace and that a good State administration was the best option in order to seek a healthy separation of the left resources. At the UN, at the moment it ceased to exist, Brazil immediately engaged in conversations with the United States, United Kingdom, and France to establish new market bonds—as a strategy to maintain the Brazilian capital in a period of scarcity.

Thus, Brazil enters this conference hopeful to strive for further communication and resource sharing on a global level, with potential new international organs as part of its proposal.

President of Republic:

Mauricio Ruiz, 63 years old

He rose to prominence by coordinating agricultural production and freshwater distribution throughout Brazil during the Scarcity Period. An alumnus of Link Business School (business major) and with a bachelor's degree in economics at Senac, he always demonstrated interest in management. Yet, at the political and national levels.

President of the Federal Senate:

Larisa de Macedo Macha (a.k.a. Anitta), 106 years old

One of the most famous users of "Pill Plus" is Anitta; she began to gain political recognition when, in 2027, she was invited to serve as Minister of Culture under Lula's

	government (moving from the music sector to politics, just like her predecessor in the position, Margareth Menezes). After being invited to take on the role and assuming it, he decided to enroll in a bachelor's degree program in Public Policy Management at USP. Chief of Justice of the Supreme Court: Augusto Fabbri Melo, 42 years old Describing him briefly and coldly: a man with a serious face and a legalistic demeanor. After years serving in the judiciary, he was recognized as Chief Justice of the Supreme Court. He completed his primary education at Ribeirão Preto's Escola Concept and then studied at the Law Department of the Pontifical Catholic University of Rio de Janeiro.
Russian Federation 	The Russian Federation entered the second half of the 21st century as a major military and technological power but was profoundly transformed by the Iron Dawn Incident in 2059, when an AI weapons experiment malfunctioned and caused widespread destruction within Russian territory. The disaster triggered the independence of the Soviet Siberian Republic (SSR) and significantly weakened Russia's economy, territory, and international standing. Unlike the neutral SSR, Russia became one of the main participants in World War III, further exhausting its resources and infrastructure. By 2100, with a population of approximately 95 million, Russia remains an influential global power, relying on its advanced technology, nuclear energy, and industrial capacity while prioritizing national recovery, resource security, and international stability.

	Despite the destruction caused by the Iron Dawn Incident, WWII, and resource scarcity, Russia has focused on post-war recovery and rebuilding its infrastructure. Right now, Russia is concerned with the long-term effects of war, infrastructure destruction, and resource shortages that the country is facing. For Russia, this conference should seek to fulfill its priorities, which mainly rely on national recovery, resource security, protecting strategic capabilities, restoring its international standing, and preventing further instability related to AI and autonomous weapons. Head of Government: Dmitri A. Volkov (68 years old) Serving as Head of Government since 2003, Dmitri Aleksandrovich Volkov is recognized for leading Russia's post-war recovery. In 2005, he launched the National Strategic Recovery Program, focusing on rebuilding infrastructure, expanding nuclear energy, and strengthening safety regulations for artificial intelligence technologies. Volkov holds a Bachelor's degree in Economics from Moscow State University and a Master's degree in Public Administration from RANEP. He is known for his pragmatic leadership and emphasis on national recovery and technological development. Minister of Foreign Affairs: Natalia V. Sokolova Natalia Viktorovna Sokolova serves as the Russian Federation's Minister of Foreign Affairs and has led the country's efforts to restore its international standing after World War III. She has focused on strengthening diplomatic relations, negotiating agreements on Arctic resources and strategic minerals, and promoting international discussions on artificial intelligence
--	--

	governance. Sokolova holds a Bachelor's degree in International Relations from MGIMO University and a Master's degree in Global Governance from King's College London. She is recognized for balancing Russia's strategic interests with a pragmatic approach to international cooperation.
United Kingdom of Great Britain 	By 2100, the United Kingdom remains one of the world's largest economies and a major global power, but decades of resource scarcity, economic disruption, and social unrest have transformed the country. Although Britain successfully rebuilt its financial system following the suspension of the Premier League and the wider economic crisis, its recovery was accompanied by increasing political centralization and the erosion of democratic institutions. Britain has developed Crown Nationalism, an authoritarian ideology combining British nationalism, monarchical symbolism, economic corporatism, militarization, and strict internal security. Parliament and elections don't exist anymore, and political opposition and civil liberties have been heavily restricted. The government justifies these measures as necessary to protect national unity and prevent extremism, foreign interference, and instability in the 'Great British Empire' Britain continues highly developed, with finance, maritime industries, and strategic corporations forming the backbone of its economy. However, resource scarcity has made secure international supply chains essential. The government therefore prioritizes energy, food, technology, finance, and shipping while maintaining close cooperation with major corporations. The nation is a global mediator and major maritime power, focused on protecting international trade routes as a central national-security priority, while the

	Commonwealth has regained strategic importance. Britain supports international cooperation when it protects stability and British interests, but strongly opposes foreign interference in its domestic affairs. The country is relatively stable compared with many nations affected by the resource crisis, although this stability has come at the cost of political freedoms, increased surveillance, and growing social divisions. Britain's global priorities are resource security, maritime trade, economic stability, national sovereignty, and preventing global conflicts. It will support cooperation when beneficial while defending its authoritarian system and strategic interests. King of the United Kingdom: His Majesty King Leonard VII, 92 years old Overseeing all countries in the province and the Commonwealth of Nations, King Leonard mostly symbolizes a figure instead of actually working and leading. From the few available archives, the chairs were able to discover that he studied economic sciences at the University of São Paulo. Prime Minister: Mackenzie Jean Rowling Murray (95 years old) J.K. Rowling's daughter, Mackenzie, studied business administration at Coventry University and made her postgraduate studies at the University of Cambridge. President of the Supreme Court: Lord Domingo Ferdinand (19 years old) The gilded doors of Parliament Square slammed shut, muting the outrage outside. At just nineteen years old—and without a single day of college or formal legal
--	--

	training—Lord Domingo Ferdinand took his seat as president of the Supreme Court. It was an impossible legal heist. By weaponizing obscure constitutional loopholes and political leverage, Ferdinand had shattered centuries of precedent, bypassing every legal requirement to claim the highest bench in the land. Adjusting his robes, he looked down at the stunned assembly of veteran lawyers. "They say power requires a law degree and forty years of patience," Ferdinand said, his voice cold and steady. "They are wrong. Power simply requires knowing how to rewrite the rules." He struck the gavel, sealing the absolute takeover of the judiciary. With several other problems in the world, this situation was taken aside.
Soviet Siberian Republic 	The Soviet Siberian Republic (SSR) is an independent socialist state created after separating from Russia in 2059. During World War III, the SSR maintained strict neutrality, protected by its geographical isolation and policy of strategic non-alignment. Despite avoiding direct military involvement, the global resource crisis severely affected Siberia. Disrupted trade and damaged infrastructure caused recurring shortages of food, energy, and industrial materials. Its population of approximately 75 million is concentrated in major cities, particularly in regions with relatively abundant natural resources. Siberia's extreme climate creates additional challenges for transportation, agriculture, and infrastructure. However, the SSR possesses significant freshwater reserves, rare-earth minerals, and other strategic resources. The government has invested heavily in water security, renewable energy, and resilient infrastructure. These resources have increased foreign interest in Siberia, creating concerns over external exploitation. The SSR's priorities are preserving

	neutrality, protecting sovereignty, securing trade partnerships, ensuring resource security, and preventing foreign control of its freshwater and mineral reserves. It favors diplomacy, non-alignment, and mutually beneficial resource agreements. Head of Government: Alik F. Bronislav (66 years old) Serving as Head of Government since 2094, Alik Fyodorovich Bronislav is credited with stabilizing the SSR's economy during a period of resource shortages and economic decline. In 2097, he launched the National Water Security Initiative, creating extensive water reserves that ensured the country's long-term water independence. His administration also introduced economic reforms, modernized infrastructure, and expanded investments in renewable energy and resource industries. Bronislav holds a Bachelor's degree in Public Policy from Far Eastern Federal University and a Master's degree in International Relations from the University of Pennsylvania. He is known for his pragmatic and long-term approach to governance. Minister of Foreign Affairs: Aelita K. Arkady Aelita Konstantinovna Arkady serves as the SSR's Minister of Foreign Affairs and is one of the leading figures behind the country's modern diplomatic strategy. As Foreign Minister, she has focused on maintaining the SSR's policy of strategic neutrality, strengthening relations with neighboring countries, and expanding trade partnerships. She has also played an important role in securing agreements on freshwater resources and rare-earth minerals, two of the republic's most valuable strategic assets. Arkady holds a Bachelor's degree in Political Science from Novosibirsk
--	--

	State University and a Master's degree in International Security from the Graduate Institute of International and Development Studies in Geneva.
Atlantic Union 	The Atlantic Union is a successor state created after the peaceful dissolution of the United States through the 2093 Denver Accords. Comprising primarily former eastern states, including Washington and New York, it preserved much of its governmental infrastructure and remained economically active, particularly through tourism and international commerce. The Union is governed by an extreme right-wing, authoritarian regime dominated by the Kirk political dynasty. The government promotes aggressive nationalism, political centralization, militarization, and strict social control, while opposition movements and civil liberties have been heavily restricted. The regime presents itself as the protector of American identity and national order following the chaos of the Secession Crisis. Resource shortages, migration, and overcrowding remain major domestic concerns. The Atlantic Union therefore seeks greater control over resources and views the resource-rich United States as both a strategic competitor and potential source of essential supplies. For the Atlantic Union, this conference highlights its priorities as resource security, economic power, technological development, political control, and national sovereignty. It will favor agreements that strengthen its influence while resisting international interference in its domestic affairs. President of the Atlantic Union: Erika Kirk (111 years old)

	Another very famous user of the Pill Plus, Erika honored the legacy of her dead fiancé, Charlie, and explored the world of politics. She studied at Regis University and, later in 2080, completed a course at Harvard Business School on administration. Surgeon General of the Atlantic Union: Mason Kirk Sandler (72 years old) Born from an affair between Erika Kirk and Adam Sandler back in 2028, Mason always demonstrated interest in medicine and politics. Especially during his mom's government, he got nominated as the nation's chief spokesperson on public health issues. Atlantic Secretary of State: Marcia Felix Kirk (38 years old) Some activists commonly refer to the Atlantic Union as the "Kirk Dynasty," and they couldn't be more correct. As Erika's granddaughter, Marcia got invited to the position after years in the Atlantic Senate. About their stability, the country maintains a right-winged political system that operates smoothly, and they still seek traditional U.S. values (God, MAGA, pride, etc.).
Cordillera State 	The Cordillera State is one of Latin America's most stable and successful examples of regional integration. Founded in 2083 through the Treaty of San José, it united Honduras, El Salvador, Nicaragua, and Costa Rica into a federal republic. The state centralized water distribution, food production, and border management, allowing it to withstand the global resource crisis more effectively than many nations. With approximately 58 million inhabitants, most of its population lives in fertile

	agricultural valleys and urban centers. The country is internationally recognized for sustainable agriculture, freshwater management, and cooperative food policies. Strong resource planning has also contributed to comparatively favorable humanitarian conditions. The Cordillera State's priorities are protecting its resource-management model, expanding regional cooperation and influence, ensuring equitable access to water and food, and preventing resource disputes from destabilizing Latin America. It supports multilateral cooperation and sustainable development while seeking to demonstrate that regional integration can provide long-term resilience against global scarcity. Head of Government: Mateo R. Cárdenas (61 years old) Serving as Head of Government since 2092, Mateo Rafael Cárdenas is widely credited with transforming the Cordillera State into one of the world's leading examples of sustainable resource management. In 2098, his administration helped establish the South Food Accord, promoting coordinated agricultural production, water conservation, and fair food distribution throughout South America. Cárdenas holds a Bachelor's degree in Agricultural Engineering from the University of Costa Rica and a Master's degree in Public Administration from the University of Chile. He is known for his cooperative leadership style and strong commitment to food security. Minister of Foreign Affairs: Isabela M. Salazar Isabela María Salazar serves as the Minister of Foreign Affairs and has become one of the country's most respected diplomats. She has focused on strengthening
--	--

	regional cooperation, expanding freshwater-sharing agreements, and promoting peaceful solutions to resource disputes. Salazar also played an important role in negotiating partnerships that supported the success of the South Food Accord. She holds a Bachelor's degree in International Relations from the National University of Costa Rica and a Master's degree in Sustainable Development from the University of São Paulo (USP). She is recognized for her pragmatic diplomacy and strong support for multilateral cooperation.
Republic of France	France remains a politically stable republic but has lost much of its former global influence following the collapse of the United Nations and the Security Council system. Nevertheless, it remains an important diplomatic actor, particularly through water-sharing agreements in the Mediterranean. France has strengthened its resource independence through the National Resource Security Program, reducing reliance on foreign strategic minerals and improving domestic resilience. Humanitarian priorities include maintaining reliable access to water, energy, food, and critical minerals, while preserving European stability. France's priorities are resource security, European stability, multilateral cooperation, and strategic independence. It supports international resource-sharing and sustainable development while protecting its sovereignty and reducing vulnerability to foreign shortages. President of France: Élodie Moreau, 83 years old Responsible for leading water-sharing agreements on the Mediterranean in 2097. Widely respected for her ability to maintain peace and cooperation. She studied

	Technology, Policy, and Management (TPM) at the Delft University of Technology (TU Delft). Prime Minister: Thomas Delacourt, 51 years old An economist and former Minister of Ecological Transition, he is best known for implementing France's National Resource Security Program, which reduced dependence on foreign strategic minerals and focused more on national supplies. Minister of Foreign Affairs: Amélie Moreau, 76 years old Élodie's young sister, Amélie, strongly advocates multilateralism and international resource-sharing agreements. She also studied Technology, Policy, and Management (TPM), but she chose the University of Texas at Austin instead.
Democratic Republic of Congo 	The Democratic Republic of the Congo (DRC) is directly involved in the topic, but it is a victim rather than an active nation. During the Olympic attack that initiated the Scarcity War, the match that was taking place was between the DRC and Türkiye. Then, on the 21st, the DRC, together with Turkey and other nations, immediately proposed the removal of China's permanent power. The attack caused great fear in the population from the DRC, which made the entire nation isolate itself from international commitments and/or treaties to prevent attacks while also committing to a creation of national protection. Nonetheless, after the attack, the DRC adopted a hushed position. It quieted itself to avoid more chaos and felt threatened by China. Until now, this

	country has only been seen as a victim of a past accident, without a clear current position. Therefore, it is the delegate's duty to explore it. President of the republic: Debora Youta, 37 years old She came from a very underprivileged family in the northeastern region of the Congolese Republic. By selling homemade pies on the streets, she was able to stabilize her life and enter her dream university, the University of Lubumbashi, in the major of Public Relations. First Gentlemen of the republic: Maximiano Youta, 48 years old Debora's husband enters the list due to his influence on his wife's decision-making. There are not many available sources on his academic background; therefore, we cannot judge his capacity to "govern" alongside his fellow wife.
Commonwealth of Australia 	By 2100, Australia remains a constitutional monarchy and one of Oceania's most important surviving states, but is among the countries most severely affected by climate change. Rising sea levels have submerged or rendered parts of several Pacific nations increasingly uninhabitable, forcing populations from Tuvalu, Kiribati, New Zealand, and other vulnerable islands to relocate to Australia. Australia has consequently become a safe haven for climate-displaced populations, accepting millions of migrants seeking habitable land, security, and access to essential resources. However, this humanitarian role has produced severe overcrowding, infrastructure strain,

	and growing social tensions. Climate anxiety is widespread as Australians confront the possibility of further territorial and environmental losses. Entering the conference, Australia's priorities are climate migration, habitable land, water and food security, infrastructure capacity, and international burden-sharing. It seeks stronger global mechanisms to support displaced populations while protecting its own survival. King of Australia: His Majesty King Leonard VII, 92 years old Serves as Australia's constitutional Head of State, as well as for other nations affiliated with the Commonwealth of Nations. His role is primarily ceremonial but also represents tradition and national unity. Governor-General: Victoria Leichter, 38 years old A former Chief Justice of the High Court of Australia, Victoria serves as the king's representative in the country. Known for being severely strict, she was important when aiding climate refugees and providing them support. Prime Minister: Charlotte Reid, 23 years old From an activist influence to the Prime Minister of Australia, Charlotte became one of the youngest heads of government in the country's history. She used to promote campaigns regarding environmental justice, mental health, and youth political participation.
--	--

Indian Republic

India remains one of the world's largest and most influential nations, with approximately 1.2 billion people. Its population growth slowed significantly due to an aging population and resource scarcity. Water shortages, agricultural stress, and extreme climate events placed particular pressure on densely populated regions, while rising sea levels displaced vulnerable coastal communities.

Despite these challenges, India avoided political fragmentation through major investments in renewable energy, sustainable agriculture, water management, and technological innovation. Its enormous labor force and consumer market remain central to its economic influence.

India has emerged as a leading voice of the Global South, promoting technological cooperation, equitable resource access, and development without excessive dependence on major powers. It supports multilateral solutions but strongly defends sovereignty and opposes unequal resource arrangements.

Entering the conference, India's priorities are freshwater security, food production, renewable energy, technology sharing, climate adaptation, and equitable access to resources. India seeks cooperation while ensuring developing nations are not excluded from the technologies necessary for survival.

Head of Government:**Arjun P. Mehta (58 years old)**

Serving as Prime Minister since 2094, Arjun Prakash Mehta is credited with expanding India's renewable energy network and modernizing national water management systems during the post-war recovery. In 2096, he launched the National Sustainability and Innovation Initiative, encouraging investments in

	artificial intelligence, clean energy, and climate-resilient agriculture. Mehta holds a Bachelor's degree in Engineering from the Indian Institute of Technology Delhi (IIT Delhi) and a Master's degree in Public Policy from the National University of Singapore. He is known for his pragmatic leadership and emphasis on technological development and economic resilience. Minister of Foreign Affairs: Ananya R. Kapoor Ananya Radhika Kapoor serves as the Minister of Foreign Affairs and has become one of India's leading voices for international cooperation on resource security and sustainable development. She has focused on expanding partnerships across Asia and the Global South, promoting agreements on freshwater management, renewable energy, and technology sharing. Kapoor holds a Bachelor's degree in Political Science from the University of Delhi and a Master's degree in International Relations from Jawaharlal Nehru University (JNU). She is recognized for her diplomatic approach and commitment to multilateral cooperation in addressing global resource scarcity.
United States of America 	The United States is fundamentally transformed. After decades of resource shortages, economic decline, migration, and disputes over water, food, and energy, the Denver Accords of 2093 dissolved the former federal structure, separating the eastern states into the Atlantic Union. The remaining United States, with approximately 170 million inhabitants, is centered around Denver and controls much of North America's agricultural land, freshwater, and energy reserves. Its population decline resulted primarily from prolonged resource scarcity,

	economic instability, declining birth rates, and migration. The government is highly centralized and resource-nationalist, prioritizing national resilience, technological innovation, and strategic resource control. Diplomatically, it follows a pragmatic and selective approach, cooperating when beneficial while strongly defending its sovereignty. Its priorities are water, food, energy, technological development, national security, and resource sovereignty. It will resist international attempts to restrict its control over strategic resources at all costs. Head of Government: Ethan J. Walker (57 years old) Serving as President since 2094, Ethan James Walker is credited with stabilizing the newly reorganized United States after the national separation. In 2096, he introduced the National Resource Independence Program, expanding investments in sustainable agriculture, advanced manufacturing, and energy infrastructure to strengthen domestic self-sufficiency. Walker holds a Bachelor's degree in Agricultural Economics from Texas A&M University and a Master's degree in Public Policy from the University of Colorado Denver. He is known for his pragmatic leadership and strong commitment to resource security and economic resilience. Secretary of State: Olivia M. Brooks Olivia Margaret Brooks serves as the Secretary of State and has led the United States' diplomatic efforts in the post-war era. She has focused on strengthening
--	--

	partnerships across the Americas, negotiating agreements on freshwater management, strategic minerals, and technological cooperation, while preserving the country's policy of resource sovereignty. Brooks holds a Bachelor's degree in International Relations from Georgetown University and a Master's degree in Global Affairs from Columbia University. She is recognized for balancing national interests with pragmatic international diplomacy.
Republic of South Africa 	South Africa has emerged from World War III as one of Africa's leading regional powers and a major hub for trade, mining, and technological development. However, severe water shortages, climate change, and decades of global economic instability continue to threaten its stability. With approximately 72 million inhabitants, South Africa has invested heavily in renewable energy, desalination, water conservation, and agricultural modernization. These policies have strengthened national resilience and helped maintain relatively stable humanitarian conditions despite persistent resource pressures. Diplomatically, South Africa acts as a leading voice for the African continent and developing nations, advocating greater representation in global resource decisions and stronger regional cooperation. It supports international partnerships but insists that African resources remain under African control. Entering the conference, its priorities are freshwater security, food security, sustainable mineral management, renewable energy, African cooperation, and greater developing-world representation. Head of Government:

	Naledi T. Mbeki (56 years old) Serving as President since 2093, Naledi Thandeka Mbeki is recognized for leading South Africa's post-war economic recovery and environmental reforms. In 2096, she launched the National Water and Energy Resilience Initiative, expanding desalination projects, renewable energy production, and sustainable agriculture. Mbeki holds a Bachelor's degree in Economics from the University of Cape Town and a Master's degree in Public Policy from the University of Oxford. She is known for her collaborative leadership and commitment to balancing economic growth with environmental sustainability. Minister of Foreign Affairs: Sipho K. Dlamini (58 years old) Sipho Khumalo Dlamini serves as the Minister of Foreign Affairs and has focused on strengthening South Africa's leadership within the African continent. He has promoted regional agreements on freshwater management, strategic minerals, food security, and cross-border infrastructure, while advocating for greater cooperation between developing nations. Dlamini holds a Bachelor's degree in International Relations from the University of Pretoria and a Master's degree in Global Governance from the University of the Witwatersrand. He is recognized for his pragmatic diplomacy and strong support for multilateral cooperation.
Kingdom of Denmark	Denmark remains a highly stable constitutional monarchy, with executive authority primarily held by the Prime Minister rather than the King. It is regarded as an important contributor to European stability and a reliable humanitarian partner.

Following the Norwegian Olympic catastrophe, Denmark demonstrated its commitment to regional cooperation by providing over €300 million in loans to support Norway's reconstruction. The relocation of its capital to Billund in 2092 further reflects Denmark's ability to adapt to environmental and geopolitical changes.

Denmark maintains comparatively strong humanitarian conditions through effective social welfare, agricultural management, and environmental adaptation. Diplomatically, it favors multilateral cooperation, humanitarian assistance, and European solidarity, while protecting its own food and resource security. Denmark's priorities are European stability, food security, sustainable resource management, humanitarian cooperation, and social welfare. It seeks practical international solutions to resource scarcity without compromising national resilience.

Prime Minister:

Freja Andersen, 40 years old

Freja Andersen, trained in environmental economics at the University of Copenhagen, is recognized for her work managing national agricultural resources and areas. Her leadership style is accompanied by a concern for social welfare, making Denmark one of the most stable countries in the world.

Monarch of Denmark:

His Majesty King David IV, 67 years old

As a constitutional monarch, the king has earned widespread respect for his commitment to national and continental (Scandinavian) unity. During decades of global instability, he has become a symbol of continuity and resilience. His public speeches during humanitarian

	and environmental crises are powerful and impactful. One of his most remarkable achievements was the relocation of Denmark's capital in 2092. Billund became the country's capital, the city where the monarch came from, and he says that "its genuine welcome justifies this honor."
Cuban Republic 	Cuba remains a politically stable socialist republic, having endured the global resource crisis and World War III through centralized resource management and strong public services. With approximately 10 million inhabitants, the country has prioritized food self-sufficiency, urban agriculture, renewable energy, and freshwater conservation. Although recurring shortages of energy and imported goods challenged the country during the war, Cuba's focus on domestic production and climate-resilient agriculture prevented severe humanitarian collapse. These policies have allowed it to maintain comparatively stable living conditions despite limited access to international resources. Cuba remains an important diplomatic actor in the Caribbean and strongly advocates for resource sovereignty, food security, equitable access to essential goods, and developing-country cooperation. It supports international humanitarian and environmental initiatives while opposing systems that allow powerful nations to monopolize critical resources. Its conference priorities are food sovereignty, freshwater security, renewable energy, public services, equitable resource distribution, and international cooperation. Head of Government: Camila R. Valdés (54 years old)

	Serving as President since 2094, Camila Rosa Valdés is recognized for modernizing Cuba's agricultural sector while preserving the country's strong public service system. In 2097, she launched the National Food Security Program, expanding climate-resilient farming, renewable energy projects, and local food production. Valdés holds a Bachelor's degree in Agricultural Sciences from the University of Havana and a Master's degree in Sustainable Development from the University of Havana. She is known for her pragmatic leadership and emphasis on food sovereignty and social stability. Minister of Foreign Affairs: Alejandro M. Ortega Alejandro Miguel Ortega serves as the Minister of Foreign Affairs and has focused on strengthening Cuba's diplomatic relations throughout Latin America and the Caribbean. He has promoted regional cooperation on disaster preparedness, freshwater management, and public health while encouraging dialogue between developing nations. Ortega holds a Bachelor's degree in International Relations from the University of Havana and a Master's degree in International Development from the University of the West Indies. He is recognized for his cooperative diplomatic style and commitment to multilateral solutions for global resource challenges.
United Mexican States 	Mexico remains a federal presidential republic and a major geopolitical actor in North America. Its proximity to both successor states of the former United States has made Mexico essential to maintaining regional stability, particularly following the American separation crisis. During the dissolution, Mexico adopted humanitarian policies to welcome people displaced by the conflict,

	establishing itself as an important destination for climate and political migrants. However, continued migration, drought, and water scarcity have placed significant pressure on its infrastructure and resources. Mexico has responded by prioritizing water security, infrastructure modernization, resource sovereignty, and regional cooperation. It acts as a pragmatic mediator between North American powers while strengthening ties with Latin America. Mexico's priorities are migration management, freshwater security, regional cooperation, resource sovereignty, and preventing conflict between North America's major powers. It supports international cooperation while defending its independence and regional interests. Head of State and Government: Alejandro Cárdenas, 54 years old A specialist in water security policies, Alejandro Cárdenas gained prominence after coordinating national drought response programs during the final years of the War on Scarcity. He advocates for resource sovereignty, infrastructure modernization, and stronger cooperation with Latin American partners. Secretary of Foreign Affairs: Valeria Monteyanor, 78 years old A career diplomat who studied international relations at Harvard University, Valeria is known for her huge effort in the area of continental migration. Secretary of Environment and Resource Security: Davi Nicoletti, 32 years old He is popular for his inspiring speeches. Here is a memorable quote from one of these: "The greatest
--	---

	mistake of the 21st century was treating water as a commodity when it should have been treated as a right."
Federacy of Germany 	Germany remains one of Europe's strongest industrial and technological powers, despite the devastation of World War III and the global resource crisis. Energy shortages and disrupted supply chains pushed the country to accelerate investments in renewable energy, artificial intelligence, advanced manufacturing, and sustainable infrastructure. With approximately 68 million inhabitants, Germany continues to lead Europe in engineering, scientific research, and technological innovation. Its humanitarian conditions remain relatively stable, although maintaining reliable access to energy, food, and critical minerals remains essential. Germany acts as a major European leader and strongly supports cooperation with its European partners. It promotes technological development and environmental sustainability while defending European economic interests and resource security. Germany's geopolitical priorities are energy security, critical minerals, sustainable technology, European cooperation, and economic resilience. It will favor multilateral solutions that strengthen Europe's ability to withstand future resource crises. Head of Government: Lukas H. Schneider (59 years old) Serving as Chancellor since 2093, Lukas Heinrich Schneider is recognized for leading Germany's transition toward a highly automated and sustainable economy. In 2095, he introduced the National Green Industry Initiative, expanding investments in artificial

	intelligence, clean manufacturing, and renewable energy infrastructure. Schneider holds a Bachelor's degree in Mechanical Engineering from the Technical University of Munich and a Master's degree in Public Administration from the Hertie School in Berlin. He is known for his pragmatic leadership and commitment to technological innovation, economic competitiveness, and environmental sustainability. Minister of Foreign Affairs: Anna K. Weber Anna Katharina Weber serves as Germany's Minister of Foreign Affairs and has focused on strengthening European cooperation while expanding strategic partnerships with nations committed to sustainable development. She has negotiated agreements on clean energy, critical minerals, artificial intelligence governance, and climate resilience. Weber holds a Bachelor's degree in Political Science from the Free University of Berlin and a Master's degree in International Relations from the London School of Economics and Political Science. She is recognized for her consensus-driven diplomacy and strong support for multilateral cooperation.
Republic of Türkiye 	Türkiye remains a stable republic and an increasingly influential international actor. Its geopolitical position was transformed by the 2050 Olympic attack, during which a match between Türkiye and the Democratic Republic of the Congo was targeted. As a direct victim, Türkiye immediately advocated for the removal of China's permanent power and became a prominent voice for stronger international security mechanisms. The attack also shaped Türkiye's approach to technology and warfare. While the country continues to support technological modernization, it strongly

	opposes AI-powered and autonomous weapons, arguing that military technology must remain under meaningful human control. Türkiye's is deeply worried about civilian protection, water security, regional stability, and preventing technological warfare. Therefore, it favors stronger international institutions and cooperation while maintaining national sovereignty. Türkiye's priorities are opposing autonomous weapons, protecting civilians, regulating military AI, securing water resources, and preventing resource-driven conflicts. President of Türkiye: Selim Arslanian, 59 years old Former Vice-President of the United Nations Human Rights Council. Known for negotiating water-sharing agreements in the Middle East. He is a moderated nationalist. Prime Minister: Aylin Demir, 43 years old An economist who used to work in the leadership of the Central Bank. She actively supports technological modernization but strongly opposes AI-powered weapons. Minister of Foreign Affairs: Kerem Tormin, 27 years old Türkiye's representative at DIPLOGEN, an influential leader within the post-war resolutions scope. He is famous on social media and uses it as a platform to promote political speeches.

Timeline of Events

The Big Break of Resources (2031–2035)	The first major global resource crisis started in 2031. Water, fertile land, energy, and rare-earth minerals become deeply scarce, damaging industrial production and pushing many vulnerable populations into extreme poverty and precarious living situations. Despite international summits and proposed resource-sharing agreements, governments fail to reverse the decline.
New Chinese Technology Emerges (2043)	China is revealed to possess a state controlled AI-automated weapons system, claiming it is necessary for the nation's survival. This revelation marks a major shift toward the militarization of artificial intelligence and triggers international fear over autonomous weapons.
The Winter Olympics (2050)	An autonomous weapon attack at the Winter Olympics in Norway, killing and putting civilians in danger during a highly visible international event. China is identified as responsible for the attack, leading to the arrest of President Hu Chunhua, the removal of China's permanent power, and a major breakdown in international trust.
The Start of the Scarcity War	Competition over increasingly scarce resources and advanced military technology escalates into a

	prolonged global conflict. States prioritize national survival, military AI, energy, and strategic minerals over international cooperation and social welfare.
The Iron Dawn Incident (2059)	Russia's autonomous weapons malfunction during a military exercise and attack targets beyond the testing zone. The incident proves how dangerous uncontrolled military AI has become and transforms the existing resource conflict into a much larger global crisis. Besides that, it also leads to the formation of the Soviet Siberian Republic (SSR).
World War III	Russia's autonomous weapons malfunction during a military exercise and attack targets beyond the testing zone. The incident proves how dangerous uncontrolled military AI has become and transforms the existing resource conflict into a much larger global crisis.
The Geneva Blackout (2069)	Japan launches a massive cyberattack against the United Nations, disabling its systems and exposing sensitive information. The attack severely damages the UN's credibility and becomes one of the final major steps toward the collapse of international cooperation.
The Collapse of the United Nations	Attacks on UN facilities cripple its operations, while countries increasingly abandon its authority. By 2079,

	the UN effectively stops functioning as the world's central institution for international diplomacy and coordination.
The end of WWII and the need for a new global council.	WW3 finally ends because nations no longer possess the resources to continue fighting. With the UN gone and the planet exhausted, Rafael Porciuncula calls a new international meeting in Brazil, bringing 20 influential nations together in 2100 to decide how humanity can survive the resource crisis.

List of countries

Name	UN membership status
Japan	Former UN member state
People's Republic of China	Former UN member state
Kingdom of Norway	Former UN member state
